EDUCATION

The University of Texas at Dallas

Bachelor of Science in Computer Science

Dallas, TX

Expected Dec. 2029

TECHNICAL SKILLS

Languages: Python, Java, C++, C#, Go, Rust, Swift, JavaScript, Typescript, SQL, Bash, HTML/CSS

Frameworks & Libraries: React, Flask, Node.js, Express.js, Next.js, Tailwind CSS, Fast API, Tensor Flow, PyTorch, Pandas, MySQL, Unity

Databases & Tools: Git, Docker, AWS, Firebase, Supabase, Stripe, VS Code, Linux, Azure, Google Cloud, PostgreSQL

Spoken Languages: English (fluent), Malayalam (fluent)

PROJECTS

Full-Stack E-Commerce Platform | *Next.js, TypeScript, Supabase, Stripe*

Feb. 2026 – Apr. 2026

- Launched a revenue-generating beat store where artists browse licenses and purchase beats via automated Stripe payments, expiring download links, and transactional email delivery. Generated over **100** sales and had a **35%** repeat-customer rate.
- Engineered a secure file delivery system using atomic token claiming (compare-and-swap UPDATE) and 5-minute Supabase signed URLs, preventing duplicate downloads and unauthorized access without exposing client-side credentials.
- Designed a PostgreSQL schema with Row Level Security policies separating public/private data, a constant-time HMAC admin authentication system, and an IP-based rate limiter across **6 API routes**, reducing abuse incidents to zero post-launch.

Automated Lead Discovery Pipeline | *Python, SQLite, REST APIs, OAuth 2.0*

Apr. 2026 – May. 2026

- Built a Python CLI tool integrating **7 external APIs** (Spotify, Last.fm, YouTube, Instagram, and more) to automate music client discovery, replacing manual artist finding with a structured multi-phase pipeline to find qualified clients.
- Created a modular 4-stage pipeline (discovery → filter → enrich → score) with SQLite persistence and real-time Google Sheets sync, enabling repeatable, data-driven lead qualification at scale.
- Shipped a built-in outreach CRM layer on top of the pipeline, actively used to generate and manage qualified leads with zero additional tooling.

2D Action Game Engine | *C#, Unity*

Oct. 2025

- Designed and implemented a modular C# game engine in Unity with **6+** core systems — input handling, custom physics, enemy AI, health/state management, and level loading — applying object-oriented design and separation of concerns across **20+** classes, shipping a fully playable build **within 6 weeks**.
- Optimized real-time update loops and asset management, cutting frame time by **30%** and memory usage by **25%**; deployed a companion HTML/CSS site to distribute builds and showcase gameplay.
